cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences Anz61606-261832 represent cDNA sequences derived from several mouse, rat or human skin cell types. Sequences Anz61606-261649, Anz61725-261765, Anz61802-261811 and Anz61826 encode proteins with an N-terminal signal sequence, indicating that the proteins are secreted. Sequences Anz61650-261668, Anz61766-261780, Anz61812-261817 and Anz61827-261829 encode proteins with one or more putative dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhabit the growth of transmembrane domains. relates to novel nucleic acid sequences derived from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                   The invention relates to novel nucleic acid sequences derived from rat . CC dermal papilla, human keratinocytes and meonatal foreskin fibroblasts, CC and mouse embryonic skin, keratinocyte stem cells and transit amplifying ccells. Polypeptides of the invention may be used to treat inflammation, CC cancer and neurological diseases: The proteins may be used to stimulate ct the growth and motility of keratinocytes, to inhibit the growth of CC cancer cells, to modulate anajogenesis and tumour vascularisation, to conclude to treat inflammation, to modulate epithelial cell growth and to CC inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle CC disorders. Sequences AAZ61606-Z61832 represent cDNA sequences derived CC from several mouse, rat or human skin cell types. Sequences CC AAZ61606-Z61649, AAZ61725-Z61765, AAZ61802-Z61811 and AAZ61826 encode CC proteins with an N-terminal signal sequence, indicating that the proteins CC are secreted. Sequences AAZ6160-Z61668, AAZ61766-Z61780, AAZ61812-Z61817 CC and AAZ61827-61829 encode proteins with one or more putative

The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1123
